Sea shell COUNTING

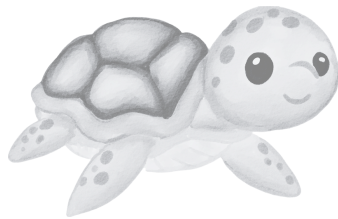

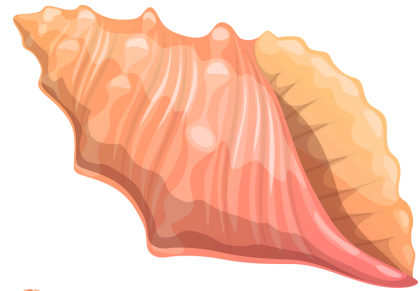

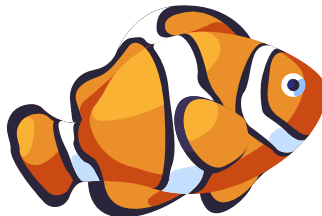

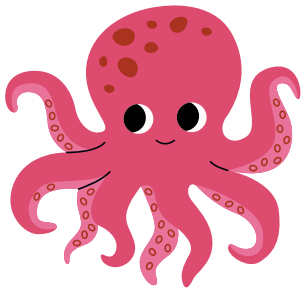

Count the sea shells and mark the number!

Name:

Date:

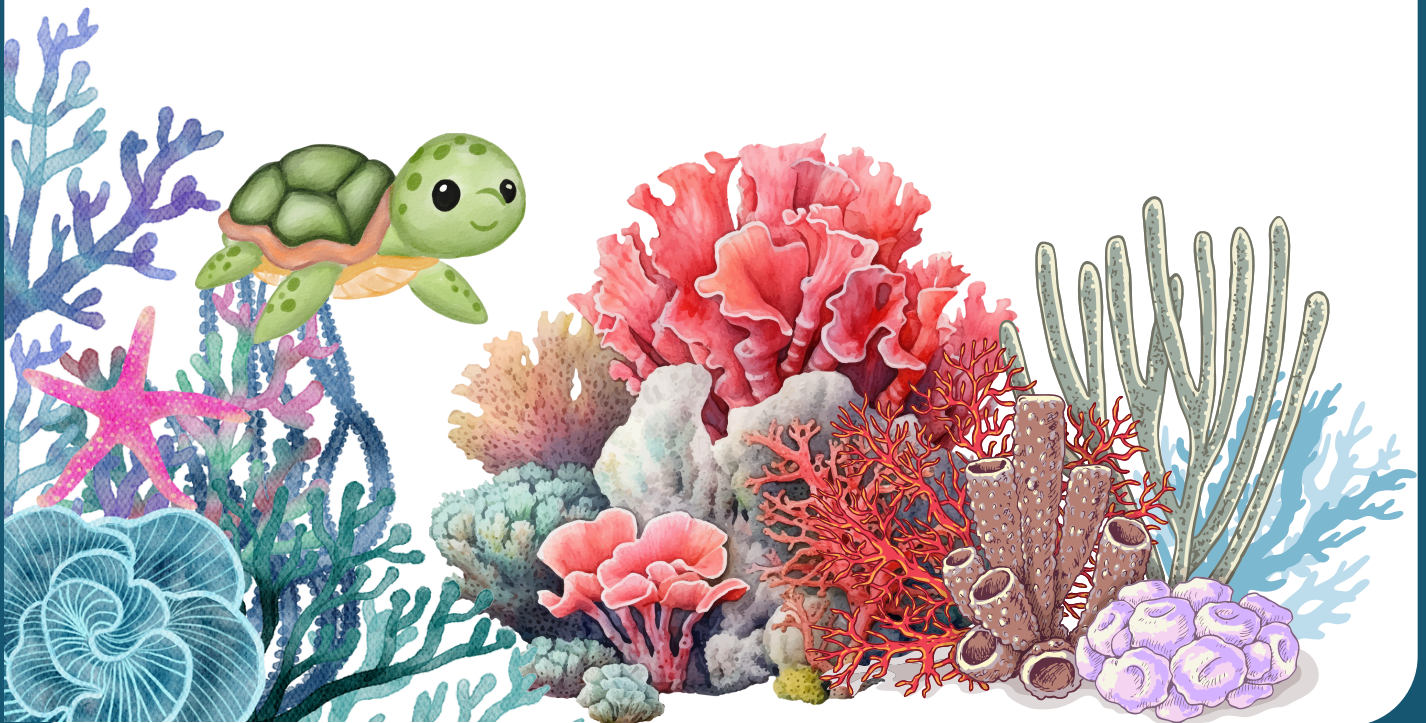

Cut and paste coral reef animals to the coral reef
The first one has been done for you.

CORAL REEF HABITAT

A coral reef is like a city under the sea!

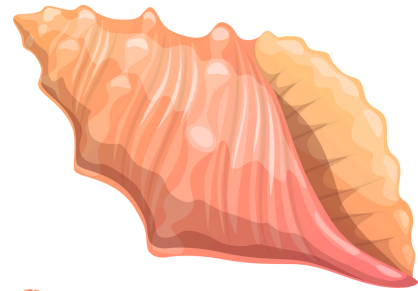

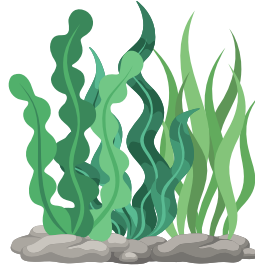

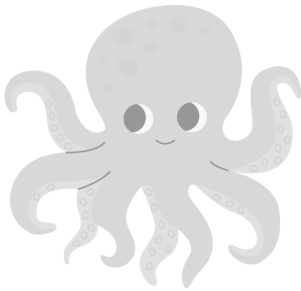

It's made of tiny animals called coral polyps that live close together and build hard shells around themselves. Over time, these shells stack up and make big, colorful reefs where lots of ocean animals live! Animals that live in coral reef include : 🐠 Clownfish (like Nemo!), 🐙 Octopus, 🐢 Sea turtles, 🦀 Crabs, 🐚 Sea snails.

Name:

Date:

Cut and paste tide pool plants and animals to the tide pool.
The first one has been done for you.

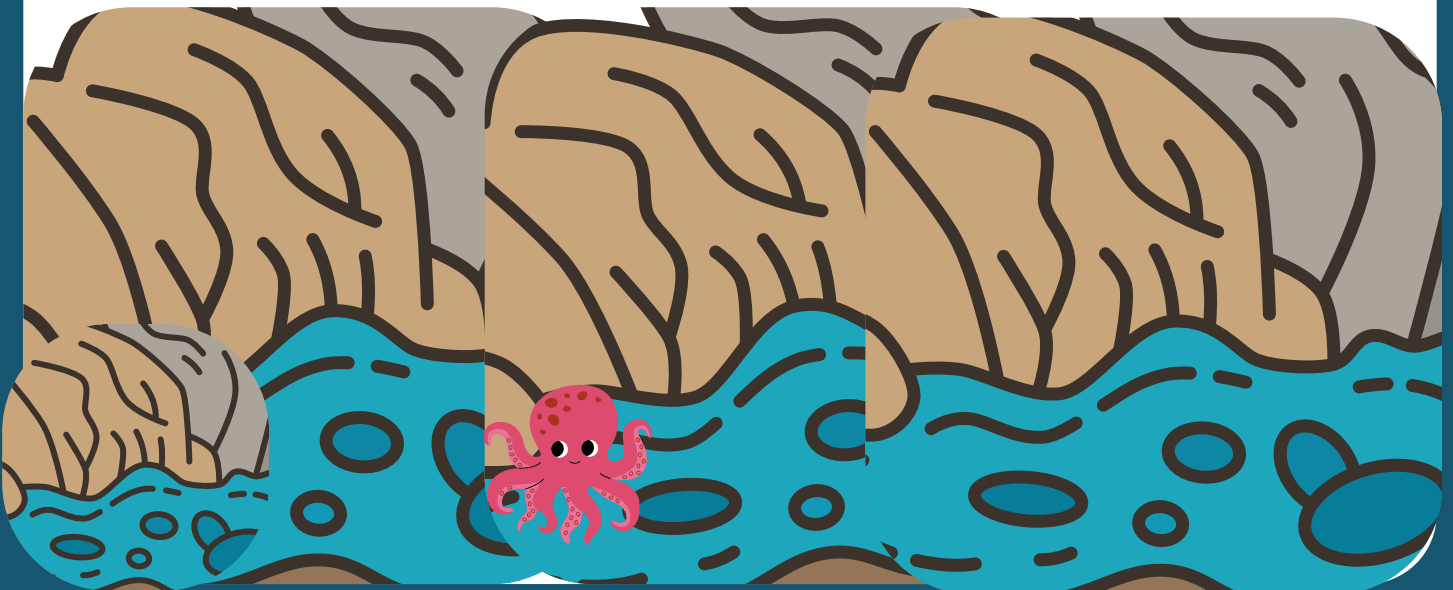

TIDE POOL HABITAT

A tide pool is a little pool of salty ocean water that's left behind on the beach when the tide goes out.

It's like a tiny ocean world you can explore!

- You can find tide pools in rocky areas near the shore, especially at low tide. Animals that live in coral reef include : 🐚 Shells, 🦀 Crabs hiding under rocks, 🌿 Seaweed waving in the water, ⭐ Starfish sticking to the rocks and 🐙 Sometimes even tiny octopuses!

Name:

Date:

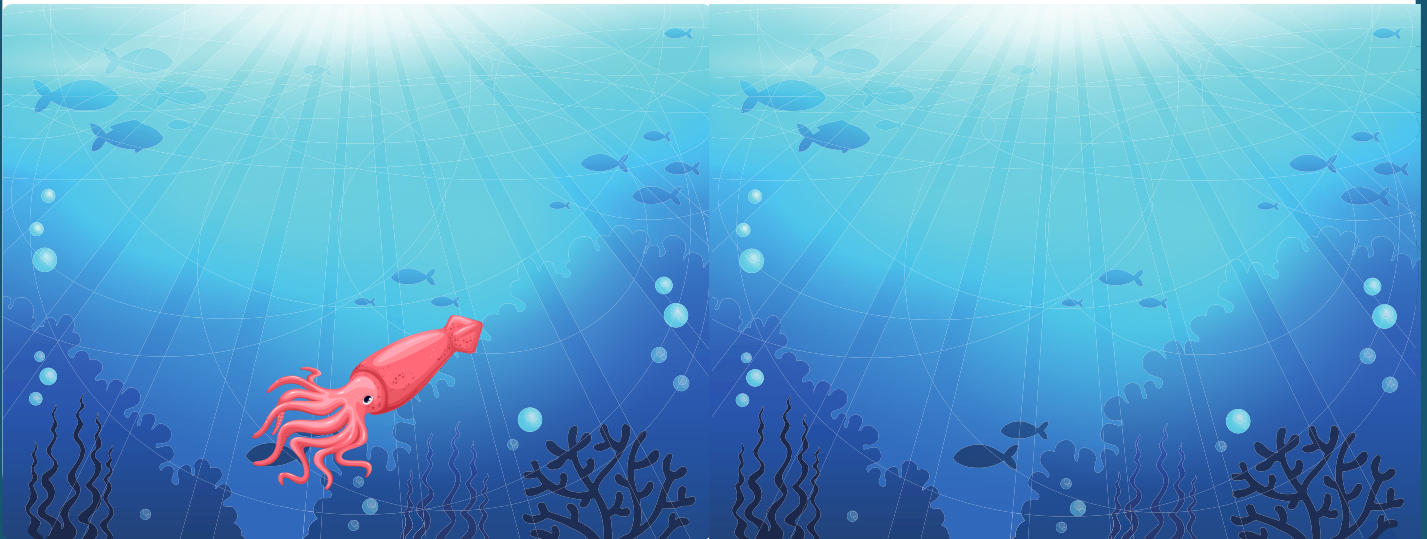

Cut and paste the animals to the deep sea.
The first one has been done for you.

DEEP SEA HABITAT

The deep sea is the very bottom of the ocean.
It's super dark, cold, and deep—so deep that sunlight can't reach it!

It's like outer space under the water. Animals and plants that can be found in deep sea habitat include: Anglerfish, 🦑 Giant squid, 🐡 Blobfish, 🌟 Sea cucumbers

WHALES

Read the text.

Whales are the biggest animals in the ocean. Some whales are even bigger than a bus! They live in the sea, but they are not fish. Whales are mammals. That means they breathe air, have warm blood, and take care of their babies.

There are two main kinds of whales: baleen whales and toothed whales. Baleen whales eat tiny animals called krill. They use special bristles in their mouth to catch food. Toothed whales, like orcas, eat fish and squid. Whales talk to each other with sounds. Some sing songs that can be heard far away! Whales swim in groups and sometimes jump out of the water. That is called breaching.

Whales are amazing animals that need our help to stay safe. We can protect the oceans by keeping them clean.

Answer the questions.

1 Are whales fish or mammals?

2 What do baleen whales eat?

3 How do whales talk to each other?

4 What is it called when a whale jumps out of the water?

Name:

Date:

SEAHORSES

Read the text.

Seahorses are tiny sea animals that live in warm, shallow water. They are called seahorses because their heads look like the head of a horse!

Seahorses are not fast swimmers. They use a small fin on their back to move through the water. They often hold on to seaweed with their tails so they don't drift away.

One very special thing about seahorses is that the daddy carries the babies! The mother puts the eggs into a pouch on the dad's belly. Later, baby seahorses come out of the pouch.

Seahorses eat tiny sea animals like shrimp. They use their long snouts to suck up food—like a straw!

Answer the questions.

1 Why are seahorses called seahorses?

2 How do seahorses move in the water?

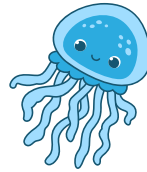

3 Who carries the baby seahorses—the mom or the dad?

4 How do seahorses eat their food?

Name:

Date:

Read the text.

Jellyfish are sea animals that float in the ocean. They have soft, squishy bodies and long, stinging tentacles. Jellyfish can be clear, pink, blue, or even glow in the dark!

Even though they are called fish, jellyfish are not really fish. They don't have bones, brains, or hearts. But they can still swim and catch food!

Jellyfish use their tentacles to sting tiny animals and bring them to their mouths. Some jellyfish stings can hurt people, so it's best to look but not touch.

Jellyfish move by pulsing their bodies like umbrellas opening and closing. They float with the water and sometimes glow at night.

Answer the questions.

1 What kind of animal is a jellyfish?

2 What body parts do jellyfish not have?

3 What do jellyfish use to catch food?

4 How do Jellyfish move?

Name: _____

Date: _____

Read the text.

An octopus is a sea animal with eight arms. It lives in the ocean, hiding in rocks and coral. Each arm has little suckers that help it grab things.

Octopuses are very smart. They can solve puzzles and even open jars! They like to hide from predators by squeezing into small spaces.

If an octopus feels scared, it can squirt out dark ink to get away. It can also change color to blend in with the ocean. This is called camouflage.

Octopuses eat crabs, fish, and other small sea animals. They catch food with their arms and bring it to their mouth, which is in the middle of their body.

Answer the questions.

1 How many arms does an octopus have?

2 What do octopuses do when they feel scared?

3 What is it called when they change color to hide?

4 What do octopuses like to eat?

Name:

Date:

STARFISH

Read the text.

Starfish are animals that live in the ocean. They are called starfish because their bodies look like stars! Most starfish have five arms, but some can have more.

Starfish don't have bones, brains, or blood. Instead, they have tiny tubes on their arms that help them move and hold onto rocks.

If a starfish loses an arm, it can grow a new one! This is called regeneration. Starfish are slow movers, but they are strong and clever.

They eat clams and oysters by opening their shells and using their stomachs to eat the soft inside.

Answer the questions.

1 How many arms do most starfish have?

2 What special thing can a starfish do if it loses an arm?

3 What do starfish eat?

4 What do starfish use to move and hold onto rocks?

Name: _____

Date: _____

CRABS

Read the text.

Crabs are animals that live in the ocean and on the beach. They have hard shells to protect their bodies and eight legs for walking. Crabs also have two claws that they use to grab food and protect themselves.

Crabs can walk sideways! They move fast across the sand and rocks. Some crabs live in water, and some live on land near the sea.

Crabs eat many things like plants, small animals, and even garbage. They help keep the ocean clean.

There are many types of crabs—some are small, and some are big. Hermit crabs are special because they live inside empty shells.

Answer the questions.

1 How many legs does a crab have?

2 How do crabs move?

3 What do crabs eat?

4 What is special about hermit crabs?

DOLPHINS

Read the text.

Dolphins are smart and playful animals that live in the ocean. They have smooth, gray bodies and a fin on their back. Dolphins breathe air, so they must come to the surface to breathe through a hole on top of their heads called a blowhole.

Dolphins live in groups called pods. They love to swim together, jump out of the water, and play. Dolphins are very friendly and sometimes swim near boats.

Dolphins talk to each other using clicks, whistles, and squeaks. They are very smart and can learn tricks!

Dolphins eat fish and squid. They use their sharp teeth to catch food, but they don't chew—they swallow their food whole!

Answer the questions.

- 1 What is the hole on top of a dolphin's head called?

- 2 What is a group of dolphins called?

- 3 How do dolphins talk to each other?

- 4 What do dolphins eat?
